

Are We Gazing at the Same Moon?

Video, Stereo Audio, Acrylic

This work reimagines moon-gazing as a ritual shared across parallel realities. By using generative AI to expand fragments of a collaged moon, it reverses the process of the “Lunar Mosaic” and challenges the idea of a singular, unified experience. Spanning audiovisual works, sculpture, and public installation, the project explores how personal memories intersect with collective memory across time and space.

Simulacra Naturae - Entangled Biomes:

Generative Ecosystems driven by Brain Organoid Intelligence

Acrylic, Clay, PLA, Stainless Steel Rods, Solenoids, Optic Fibers, Mylar, LED Matrix, Piezoelectric Ribbon Sensor, Artificial Moss, lab grade flasks, Hydroponic Plants

This multisensory installation explores how biological activity, generative algorithms, and human interaction shape aesthetic experience. Signals from organoids coordinate evolving visual, sonic, material, and haptic systems, allowing data to become a catalyst for emergence. The work forms a cyberphysical ecology in which neural dynamics and embodied participation continuously influence one another.

Stuck in The Middle

Wearable vests, shoulder mounted decorated speakers, RaspberryPi, Powerbanks

This participatory performance-installation places each wearer between two conflicting AI voices. Shoulder-mounted devices embody familiar cultural binaries and use real-time images of the surrounding environment to generate opposing advice. By turning AI guidance into an ongoing argument, the work examines how language models may reinforce binary thinking and asks whether personal agency can emerge in the uncertain space between extremes.

Sternwerk

Meteorite (Iron), 3D Print (Black SLS), CPU Cooler, Custom Electronic Components

This interactive installation connects a meteorite, Conway's Game of Life, and human breath across radically different timescales. The meteorite cools the computation and condenses visitors' breath; each falling drop, amplified through sound, resets the simulation and begins a fragile universe anew. The accumulating residue forms a material archive—a modest counter-monument to deep time and humanity's encounter with the cosmic.

Diffusion TV

CRT TV (Goldstar CMX-4200 manufactured in 1987, Korea), Raspberry Pi 5 with Custom Hardware, Modified HDMIRF Modulator, Custom Software made with Processing and Python, AI Diffusion Models (Stable Diffusion XL and Stable Audio Open)

This interactive installation uses a nostalgic CRT television to reveal how AI diffusion models transform noise into recognizable images and sounds. By adjusting the TV's knobs and antenna, viewers navigate three channels: Past, featuring extinct animals; Present, endangered species; and Future, speculative AI-generated creatures. The work reflects on the intertwined futures of technology and the environment, asking what is preserved—and what is lost—in the pursuit of progress.

Gradi

Custom software and firmware, open-weight AI models, embedded microcontrollers, IMU, micro-blower and valve, microphones, speakers and audio amplifiers, proximity and mmWave presence sensor, 3D-printed resin, synchronized four-channel 9:16 video

This suite of speculative wearable intrafaces exposes the hidden frictions behind AI's promise of effortless interaction. Each device explores a dominant logic—calibration, compression, prediction, or mediation—and how it shapes speech, identity, and agency. Through subversive artifacts and imagined use cases, Gradi resists seamless integration, keeping the seams between humans and AI visible and felt.

顫杵 (sensho)

Teensy microcontroller, tactile transducer, RGB LEDs, 3D printed PLA, custom electronics

This kinetic sculpture brings digital visual effects into physical space. Inspired by the Buddhist vajra, it synchronizes high-speed strobes with mechanical vibration to produce chromatic aberrations and glitches on a solid object. When touched, the illusion extends into the viewer's body, dissolving the boundary between two-dimensional image, three-dimensional matter, and embodied experience.

The Long Fall:

A descent into the ocean's living memory

Gravity Machine, Planktonscope, Music Pad, Bioluminescent Dinoflagellate, Camera, Mac Mini

This interactive installation reveals plankton's hidden role in regulating Earth's climate. Drawing on data from 18 expeditions with Stanford's Prakash Lab, it guides audiences from the White Cliffs of Dover into the drifting world of marine snow. A tactile "plankton instrument" triggers the descent and sound of individual species, accompanied by an AI-revived voice of Rachel Carson.

SOMA: In Search of Somatic Intelligence

Aluminum Beams, Metal Tripods, Robotic Actuators, Inertial Motion Sensors (Imu),
Microcontroller, Control Laptop

This multisensory robotic sculpture explores bodily memory as a language for human–AI communication. Visitors recreate a remembered movement through a wearable sensor, prompting the machine to respond with its own choreography. Through this intimate, non-verbal exchange, SOMA reclaims the body as a site of encounter between human and artificial beings.

A Walled City

LED screen, projection, tablet, USB button, Custom-Built Software

This interactive, generative monument explores memory, density, and collective digital presence. Inspired by the spatial logic and self-organized architecture of Hong Kong's Kowloon Walled City, a multi-agent AI system transforms participant-uploaded images into unique architectural chambers. These mnemonic capsules accumulate into an evolving, non-hierarchical urban space for collective speculation.

Dreaming Babies: illi

Blender, 3D Models Generated By Artificial Intelligence, Unity, 3D Printed Sculptures, Chatgpt System, Aluminum Structure, LED Lights

This installation imagines 23 babies with different chromosomal variations dreaming inside virtual incubators in space. Through AI-generated narratives and interactive sound, audiences encounter speculative futures of birth shaped by genetic technology. Inspired by the artist's experience with preimplantation genetic testing, the work challenges ideas of normality, perfection, and selection, reframing genetic variation as a source of identity, multiplicity, and beauty.

in-between: home, belonging, and the Asian diaspora

"Deportation": Data, Washi Paper, Arduino, Peristaltic Pump, Water, Android Phone.

"Home:1–8": Data, Washi Paper, Watercolor Silkscreen, Custom Frames.

"Home:Collective:Data", Open-source Llm (Run Locally), Projectors, Mac Mini, iPad.

This modular installation explores migration and the difficulty of defining home through fragile materials and participatory data portraiture. Drawing on the artist's own journey and interviews with seven members of Tokyo's Asian diaspora, it combines a water-based performance, suspended silkscreen portraits, and an evolving collective archive. Visitors contribute their own journeys and are connected with a stranger whose understanding of home resonates with theirs.

David Em Print Exhibition

Prints On Canvas

Since the 1970s, David Em has pioneered digital art, creating early navigable virtual worlds at NASA's Jet Propulsion Laboratory and later exploring generative AI. Fusing mathematical precision with surreal, organic forms, his environments examine transformation, perception, and the tension between natural and artificial systems. Across decades of technological change, Em's work presents digital space as a metaphor for consciousness—layered, nonlinear, and continually evolving.

2025 Ars Electronica Animation Festival

Screen Monitor, Playback Device

Selected from the Prix Ars Electronica 2025 submissions, this one-hour program presents experimental animation exploring performance, artificial intelligence, environmental collapse, media spectacle, and electronic waste. Moving from intimate rituals and digital bodies to polluted oceans, unstable cities, and post-atomic landscapes, the works reveal animation as a critical medium for confronting technological and planetary change.
